**Brief Project Description:**

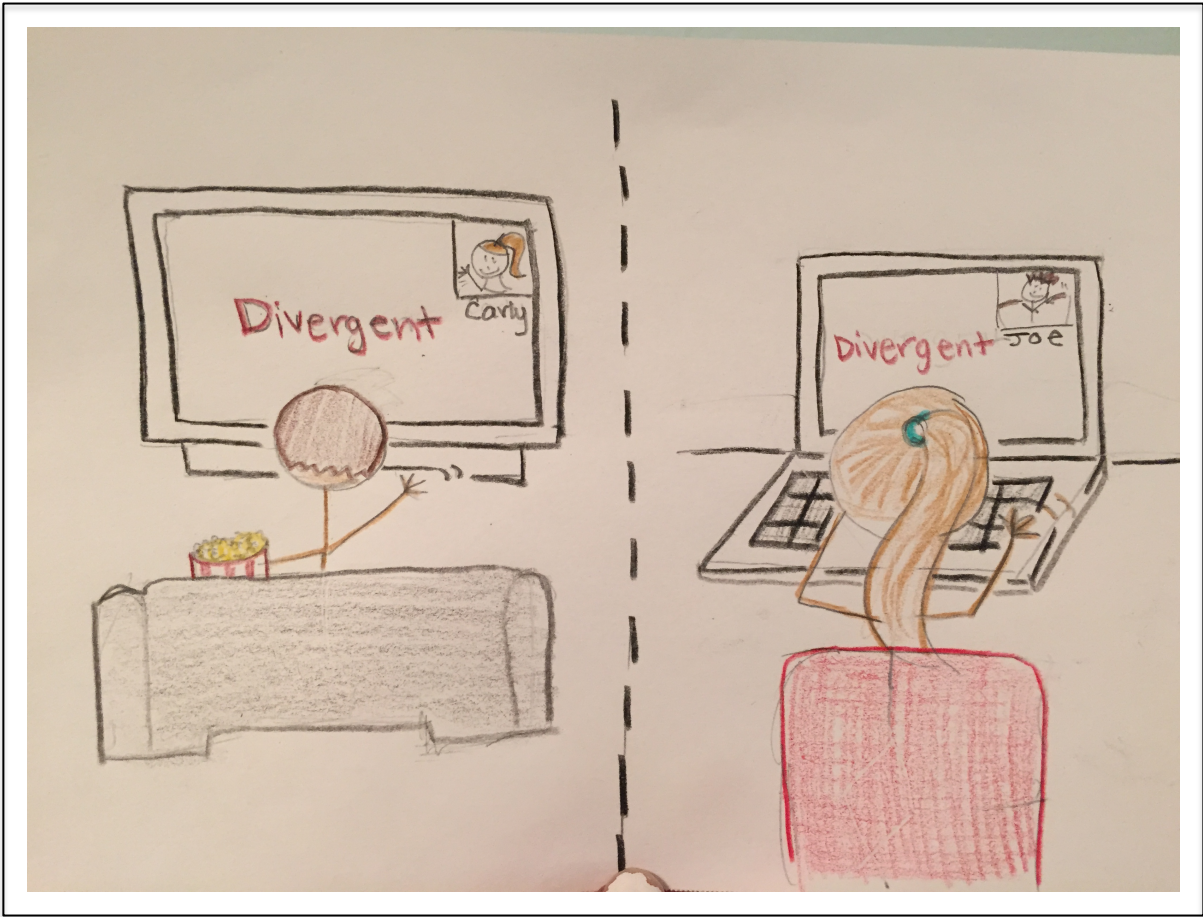

Social Stream is a social TV watching system that introduces a social aspect to an otherwise solo activity. The system works across several devices: TV, mobile phone, tablet, and laptop. The user can connect with friends and stream a show or movie while in a chat room and while video chatting. They can also schedule TV watching events, and receive reminders about events. In addition, the user can look up additional information about a character, actor, or sports player involved in the show, game, or movie they are watching. Social Stream brings people together and creates a social TV watching environment.
